Statistic Deskriptif

Table 1. Statistic Deskriptif of Data.

	views	duration_sec	likes	comments
count	1.314000e+03	1314.000000	1.314000e+03	1314.000000
mean	3.990565e+05	602.770928	1.195950e+04	249.705479
std	2.190214e+06	1728.144483	7.496155e+04	953.225144
min	0.000000e+00	5.000000	0.000000e+00	0.000000
25%	1.382500e+02	34.000000	3.000000e+00	0.000000
50%	1.562500e+03	72.000000	3.050000e+01	4.000000
75%	6.873375e+04	528.250000	1.950250e+03	86.500000
max	3.751971e+07	38936.000000	1.945553e+06	13066.000000

The dataset consists of 1,314 videos with numerical features including views, duration, likes, and comments. Overall, the distribution of engagement metrics is highly right-skewed, indicating that only a small number of videos achieve very high engagement while the majority receive relatively low interaction. The average number of views is approximately 399,056, whereas the median is only 1,562.5, highlighting the presence of a few viral videos with extremely high view counts to 37 million. A similar pattern is observed in likes and comments, where the mean values at 11,959 likes and 249.7 comments are significantly higher than the medians 30.5 likes and 4 comments, suggesting unequal engagement distribution. In terms of duration, the average video length is around 603 seconds, while the median is only 72 seconds, indicating that most videos are short, but a few very long videos up to 38,936 seconds increase the overall average. These findings suggest that the dataset is dominated by a short video of highly popular videos, reflecting the typical attention imbalance found in social media platforms such as YouTube.

Picture Explanation

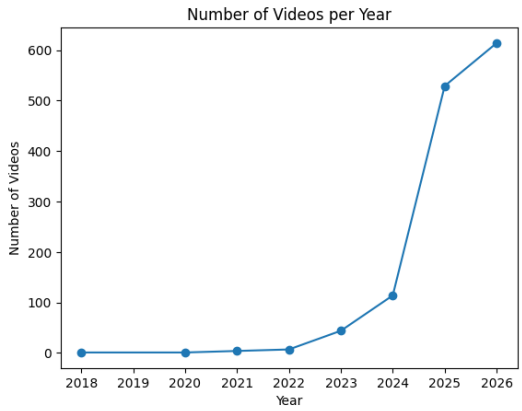

Figure 1. Number of Videos per Year.

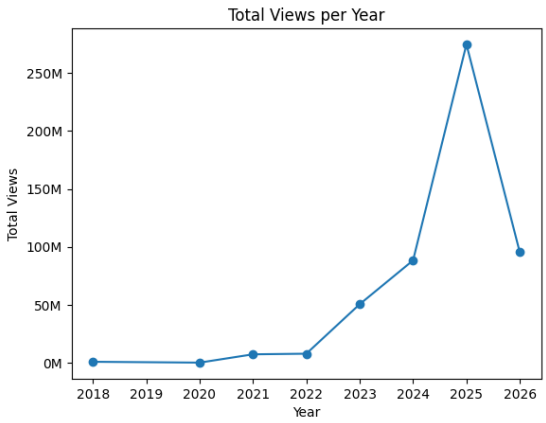

Figure 2. Total Views of Videos per Year.

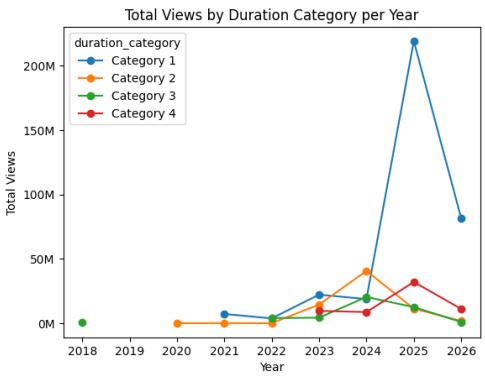

Figure 3. Total Views by Duration Category per Year.

The three figures collectively illustrate the rapid emergence and growth of *brainrot*-related content on YouTube over time. Based on the data, the number of videos began to increase gradually in 2023 and then rose sharply in 2024, reaching a peak in 2025 and continuing to

grow in 2026. This trend aligns with the period when the term *brainrot* started to gain popularity in online culture, suggesting that the increase in content production reflects the viral spread of the term itself.

This pattern is further reinforced by the total views per year, which also show a significant increase starting in 2023 and peaking in 2025. The parallel growth between the number of videos and total views indicates that the rise in content is accompanied by increased audience engagement, suggesting a growing interest in the topic. However, a slight decline in 2026 may be due to incomplete data or temporal bias, as newer videos have had less time to accumulate views.

Moreover, when analyzing total views by duration category, it is evident that short-duration videos in Category 1, less than 60 seconds dominate in terms of total views, especially during the peak period. This finding highlights the strong influence of short-form content, such as YouTube Shorts, in driving engagement. The dominance of short videos suggests that audiences tend to consume quick, repetitive, and easily digestible content, which aligns with the characteristics often associated with *doomscrolling* behavior.

Overall, these findings suggest that the rise of *brainrot* content is closely linked to the increasing consumption of short-form videos, particularly since 2023. The data supports the argument that the viral spread of the term coincides with shifts in user behavior toward high-frequency, low-duration content consumption, reinforcing concerns about reduced attention span and excessive digital engagement.
